CCM502 Hornet

The CCM502 *Hornet™ Cold Cathode* ionization gauge sensor assembly is constructed of a compact metal design resulting in a simple yet rugged sensor suitable for numerous industrial applications. Additionally a sensor activation aid mounted on the anode improves the time it takes to activate the cold cathode sensor.

The patented ultra-low magnetic stray field design expands the use of this technology beyond the traditional cold cathode applications. i.e., the CCM502 can be used in combination with instruments sensitive to external magnetic fields generated by conventional cold cathode gauges. This novel magnetic field design also allows the CCM502 Hornet to be used in environments where strong magnetic fields are present.

A unique interchangeable dual chamber inside the sensor assembly avoids cleaning cycles and reduces maintenance, making the Hornet 502 the most robust and economical

vacuum gauge of its kind.

The low current collector option is recommended for use in heavy gases such as Argon to prevent self-sputtering while the high current version is recommended for gases such as N₂ /air, etc.

The CCM502 *Hornet* ionization vacuum gauge module provides the basic signal conditioning required to turn the sensor into a complete vacuum pressure measurement instrument.

The built-in controller provides digital input control capability for sensor activation. Additionally it provides one log-linear analog output for the measured pressure and a sensor status output providing flexibility for various process control schemes.

The combination of superior sensor design and enhanced signal processing provides optimal and stable pressure readings over the entire measurement range from low to high vacuum.
