WGM701 Wasp

The WGM701 Wasp™ vacuum gauge module combines Cold Cathode Inverted Magnetron technology with a pirani sensor to provide reliable and continuous pressure measurements from atmosphere to high vacuum.

The sensor assembly is constructed of a compact metal design resulting in a simple yet rugged sensor suitable for numerous industrial applications. Additionally a sensor activation aid mounted on the anode improves the time it takes to activate the cold cathode sensor.

The patented ultra-low magnetic stray field design expands the use of this technology beyond the traditional applications when using a cold cathode technology. i.e., the WGM701 can be used in combination with instruments sensitive to external magnetic fields generated by conventional vacuum gauges utilizing a cold cathode sensor. This novel magnetic field design also allows the gauge to be used in environments where strong magnetic fields are present.

The low current collector option is recommended for use in heavy gases such as Argon to prevent self-sputtering while the high current version is recommended for gases such as N₂ /air.

A unique interchangeable dual chamber inside the sensor assembly avoids cleaning cycles and reduces maintenance, making the WGM701 the most robust and economical vacuum gauge of its kind.

The WGM701 provides the basic signal conditioning required to turn the sensor into a complete vacuum pressure measurement instrument. The built-in controller provides a log-linear analog output for the measured pressure as well as a sensor status output. The cold cathode sensor is automatically activated once the pressure measured by the pirani sensor has indicated a low enough pressure level of 7.6 x 10⁻³ Torr.

The combination of superior sensor design and enhanced signal processing provides optimal and stable pressure readings over the entire measurement range.
